Akshat Dhiman

DevOps Engineer | Kubernetes, Terraform, CI/CD, Observability and Incident Response
Boston, MA · (857) 379-6335 · dhiman.ak@northeastern.edu
github.com/AkshatDhiman07 · linkedin.com/in/akshat-dhiman-297b13190

DevOps and cloud infrastructure engineer with 4+ years running production systems on AWS and Azure, now in a cloud computing master's at Northeastern. Built CI/CD pipelines that lifted deployment efficiency 40% and cut release cycle time 60%, Terraform automation that removed 40% of manual provisioning effort, and disaster recovery that halved downtime at 99.9% availability. On-call in both roles. Available full-time from January 2027 on CPT; open to relocating to San Francisco, New York or Seattle.

Education

Chandigarh University | **B.E. Computer Science and Engineering** *2017 - 2021*
Coursework: Data Structures and Algorithms; Operating Systems; Computer Networks; Databases; C/C++

Northeastern University | **M.P.S. Informatics, Cloud Computing** | **GPA 4.00/4.00** *Jan 2026 - May 2028*
Coursework: Cloud Security; Database Management Systems; Cloud Analytics; CI/CD; DevOps Principles

DevOps and Infrastructure Experience

DevOps Engineer | **Cognizant, India** *Aug 2023 - Oct 2025*

- Operated 20+ Kubernetes clusters on Amazon EKS and Azure AKS for four enterprise clients across Dev, Int, SIT, UAT, Production and DR environments, on a six-person DevOps team.
- Ran the observability stack with Prometheus, Grafana and Loki. Tuned alerts so on-call engineers got signal instead of noise, and improved application response times 30% through the performance work that surfaced.
- Consolidated per-team clusters onto a multi-tenant design, cutting cloud spend 25% at the same workload, and wrote Python automation for recurring remediation including rolling restarts and log collection.
- Maintained the CI/CD pipelines three teams shipped through with AWS CodePipeline, CodeBuild and Jenkins, improving deployment efficiency 40% with gates that stopped broken builds.
- Took on-call rotations and triaged incidents to root cause, wrote the runbooks other engineers used, and ran 50+ sessions bringing teams onto the tooling and operational standards.

Cloud Infrastructure Engineer | **Cognizant, India** *Jul 2021 - Jul 2023*

- Automated provisioning with Terraform, Ansible and ARM templates, cutting manual provisioning effort 40% so teams could stand up environments themselves instead of filing a request.
- Designed the disaster recovery path, reducing downtime 50% and sustaining 99.9% availability against defined targets.
- Worked with security stakeholders on a recurring patch cadence, lowering deployment-related issues 35%.
- Streamlined releases with Jenkins and AWS CodePipeline, reducing deployment cycle time 60%.
- Evaluated competing tooling against client requirements, built proofs of concept, and wrote up the recommendation the team selected from.

Selected Infrastructure Projects

Kubernetes Incident Response Platform: Detection, Diagnosis and Routing *2026*
Python, FastAPI, Amazon SQS, EKS 1.31, Terraform, ArgoCD, Prometheus, Loki, IRSA · github.com/AkshatDhiman07/kubernetes-incident-platform · demo

- Built an incident path from detection to engineer: Prometheus alert rules fire, Alertmanager webhooks into an SQS publisher, and a consumer gathers metrics, Loki logs and Kubernetes deployment context in parallel before posting a root cause to Slack. Alert to Slack in under ten seconds, six alert rules across five GitOps-managed applications.
- Layered context into the prompt until output was usable: alert text alone gave generic answers, adding metrics and logs made them cite specific variables. Remediation commands come from a hardcoded allowlist of three reversible operations, not from the model.
- Proved durability with a failure-injection test: killed a pod mid-processing, confirmed the queued message came back and was handled with nothing lost.
- Provisioned VPC, EKS, ECR, SQS and IRSA roles with Terraform, no static AWS credentials in the cluster. Spot nodes with nightly teardown hold development spend under $20 a month.

Identity Lifecycle Automation: HR-Triggered Access Provisioning (in progress) *2026*
n8n, Docker, MySQL, MariaDB, FrappeHR, Snipe-IT, Azure VM, webhooks · Faculty project · github.com/AkshatDhiman07/IAM-Project

- Stood up the stack on an Azure VM: n8n, Snipe-IT and MySQL in containers on a shared network, FrappeHR native alongside MariaDB and Redis.
- Wired a webhook from the HR system into n8n so creating an employee record triggers provisioning, and designed the designation-to-entitlement mapping for Okta, Entra ID and AWS IAM. It throws on an unrecognised designation rather than falling back to a default grant.

Technical Skills

Infrastructure as Code and CI/CD: Terraform, Ansible, Azure Resource Manager templates, ArgoCD, GitOps, Jenkins, GitHub Actions, AWS CodePipeline and CodeBuild, Azure DevOps, Git
Containers, cloud and Linux: Kubernetes, Amazon EKS, Azure AKS, Docker, Helm, Linux, AWS (EC2, VPC, IAM, S3, Lambda, SQS, EventBridge, Athena), Azure (VNet, Storage)
Observability, security and scripting: Prometheus, PromQL, Alertmanager, Grafana, Loki, ELK, distributed tracing (AWS X-Ray), secrets management (AWS Secrets Manager, Azure Key Vault), on-call incident response, Python, Bash, SQL, MySQL, MariaDB, FastAPI
Certifications: Azure Administrator (AZ-104), Azure Fundamentals (AZ-900), GitHub Foundations (GH-900)
